Dear [Hiring Manager Title / CTO Name],

About Me

I am writing to explore the Enterprise Systems Architect position at [Company]. I bring over 5 years of experience designing robust business automation engines, multi-tenant database infrastructures, and scalable custom extensions within the ERPNext/Frappe ecosystem.

Why Me?

My recent work highlights my ability to transform complex real-world operational challenges into scalable, secure software architectures. As the Principal Systems Architect for the Divergent Tabletop documentation engine, I designed and deployed a single-database multi-tenant architecture utilizing PostgreSQL Row-Level Security (RLS) and transaction-scoped context injection. This strategy, combined with an in-memory transactional flushing architecture, safely reduced database write volumes by 85% under heavy user concurrency. Additionally, my background at FARO Africa includes leading the migration of business workflows from Retool into custom Expo mobile environments, significantly lowering operational latency and eliminating third-party licensing dependencies.

How I Work

I execute tasks using strict Spec-Driven Development frameworks to deliver highly maintainable codebases that align perfectly with business goals. I am eager to help optimize and scale [Company]'s enterprise core.

Best Regards,

Werner Bisschoff
